The method utilizes an Attenuated Thermal Reflectance ( ATR ) liquid cell and approximately 2 mL of sample. The spectra were collected from 48 scans together-1-1 at a slow mirror speed. Spectra were taken from 2,000 cm to 600 cm and software baseline-1 corrected ( Nicolet supplied software ) to bring the baseline to zero at 2,000 cm. The peak at-1 1,745 cm was used to determine the percent biodiesel in the sample. A small absorbance was noted from diesel fuel at this intensity and was subtracted from the peak intensity for the biodiesel blends. This technique is currently being discussed as an ASTM method to be included in future ASTM specifications for biodiesel blends. A copy of the method is in...
